

Documenting your project

- ☐ Every GitHub project should have a *README* file.
- ☐ This file, as the name implies, is a quick overview of what the project is for and how to use it.
- ☐ If you need more comprehensive documentation, you can use the built-in *Wiki* feature to create a full-featured set of interlinked documentation pages.

Command-line tools

- ☐ The primary interface to Git (and GitHub) is via your command-line.
- ☐ MacOS and Linux have Git built-in.
- ☐ Windows users will need to install a tool called Git Bash
